AI Usage Log — LoanPilot Autonomous

Purpose: This is a draft record of AI-assisted work for the assignment. Edit it to match the tools, prompts, changes and time estimates you personally used before submitting. Do not report estimates as measured facts.

Prompts that illustrate the work

• “Build a synthetic-data home-loan approval demo using BigQuery, mock credit/property checks and a human approval step.”

• “Diagnose the BigQuery `IFNULL` type mismatch and propose the smallest safe SQL correction.”

• “Compare the working app against deliverables D1–D6 and identify missing pages and documents.”

Time saved

Estimate to be completed by the author: compare the time you believe each task would take manually with actual time spent using AI. Do not claim a specific number until you have made that estimate. Suggested calculation: `estimated manual hours – actual hours = estimated hours saved`.

Limitations and responsibility

AI-generated code and text can contain mistakes. I reviewed and corrected code using observed errors, used synthetic data, and retained human decision authority. The current decision engine is deterministic rule-based logic, not a deployed LLM agent. Verify all source links and technical tests before submission.
